

here, there and everywhere

(Remote Access)

What is Remote Access?

Work from anywhere – take your desktop with you wherever you go in the world. There's no need to take your laptop as our solutions give you complete security from any PC, even a PC in an internet café. With the growth and increased speed of broadband internet, it is now easier than ever to connect to your place of work.

Enhanced productivity

Whilst this may be difficult to quantify for your business, there are many examples we can share where Remote Access has increased efficiency.

A simple example comes during times of bad weather, a home emergency or a family crisis that causes you to be miles from your office. Staying on top of the urgent emails is easy. Even planning to work from home, is now easier as so much of our daily work is digital and is easily accessible from any computer. Gone are the days of carrying box files home to work.

With some solutions, all the applications you use at your desk are available remotely, giving you access to all your files and client/customer data.

Increasing profitability

Enhancing productivity will ultimately increase profitability, as your flow of work and information is improved and your time to respond to requests is decreased. This reduces internal clutter and increases client satisfaction.

Better quality of life

For those of us with busy work commitments and family, the benefits abound, as many of our clients now get home for 6pm to spend time with family and then wrap up the day from their home computer. This solution gives time back to your employees, and in many documented cases this in turn allows them to work more effectively for the business.

If your need is just for Outlook access, or a full remote desktop, we can provide you with the right solution to fit your budget. Simple PDAs or a server sharing 20 users' desktops are among the options available. Working on the move, on the train, in a hotel, or at the airport, your solution can be tailored to meet your specific requirements for both speed of access and security.

The proof is in the pudding

A few years ago, BC technologies moved their administration and accounts departments to Scotland and consequently allowed the office size in London to be reduced. The saving per square foot was around 500%.

Our servers are located in Scotland and the team connect in using secure remote access to the servers. Today we effectively utilise both PDAs for our consultants who also have full remote desktop access via laptops.

Works for us... could we make it work for you?
